COMPLETE INSTRUCTIONS FOR LEE 4-DIE SET

1 INSPECT, PREPARE YOUR CASES
Inspect your cases to be sure they are safe for reloading. Discard all cases with split necks, indications of head separation or other defects. The ULTIMATE 4-DIE SET is equipped with both the FULL LENGTH SIZER and COLLET NECK SIZER for semi-auto rifles and cases that have been fired in your gun only. If you are using the COLLET NECK SIZING DIE, try the empties in your gun chamber before you start to reload. If they do not fit freely, you must use the FULL LENGTH SIZER.

After a few loadings, cases tend to get longer. This could be dangerous if the case were so long that it would pinch the bullet in the end of the chamber. Pressure high enough to damage the gun could result. A convenient way to trim the correct safe length is with the LEE QUICK TRIM CASE TRIMMER. Install the appropriate Quick Trim Die — and 5 quick turns of the crank will yield a perfectly trimmed and chamfered case.

2 FULL LENGTH SIZER
Screw the sizer die in until it contacts the shell holder, plus 1 turn more (1/4 turn for Classic series press owners). Run a case into the die. You will feel the primer being extracted, then the lever will come to an abrupt stop. At this point, the lever must be pushed firmly (min. 25 lbs.) to close the collet and size the neck. Extra bullet grip can be obtained by screwing the die in an additional quarter-turn.

Other brands of presses that toggle or snap over center at the end of the stroke provide no feel and can damage the collet neck sizing if adjusted as above. We suggest the die be screwed in until the die contacts the shell holder, plus 2 FULL TURNS. This will prevent the press from toggling over center and give the operator feel of the collet closing.

OPTION: Even greater accuracy can be obtained by rotating the case one-half turn and sizing the case a second time.

3 PRIME
Prime the case according to instructions supplied with your press. For maximum accuracy, speed and convenience, we suggest use of the LEE ERGO-PRIME. With this tool, you never touch the primers from box to shell. Built-in primer flipper turns the stuck case free. Lee Precision will remove a stuck case for $6.00.

4 CHARGE THE CASE
Select a load from the chart on the reverse side. This is the most critical decision you must make. An overcharge can blow up the gun and injure the primer or shooters nearby. It is dangerous to use a bullet of a greater weight with a charge for a lighter bullet. Never select a load intended for a bullet lighter than you are using. Loads for a slightly heavier bullet are safe. The Lee Dipper is the safest and easiest powder measure to use. Adjustable powder measures should be double checked with a scale. Use the starting loads. You may work up to the NEVER EXCEED LOADS gradually, provided you know how to watch for pressure signs.

CAUTION: After changing the case, the only operation that should be done is to seat the bullet. Never try to seat a primer after powder has been added.

5 EASY ADJUST DEAD LENGTH BULLET SEATING DIE
This DIE DOES NOT CRIMP
Simply screw the die in until it touches the shell holder, plus an additional 1/4 turn and finger tighten the lock ring. Bullet seating depth is controlled by the adjusting screw. Rotate the adjusting screw clockwise to seat the bullet deeper and counterclockwise for a shorter length. Bullet seating depth plays an important role in accuracy. Many shooters prefer to seat the bullet .020 to .030 inches away from the rifling. Others prefer that it just touch the rifling. Only you can determine which produces the best accuracy. Caution: Never seat bullets deeper than the minimum overall length listed by reliable load data sources.

The Bullet Seating die is equipped with a floating bullet seating punch for maximum accuracy. It is designed to seat all shapes of bullets with minimum deformation. If you attempt to compress the charge, it may deform the bullet in objectionable amounts. It will be necessary to modify the bullet seating punch to fit thebullet if unable to do yourself or have it done locally, we can do it for you. Send $14.00 along with a sample bullet, and order “Custom Seating Plug for Sample Bullet” ($8.00 for the bullet + $6.00 for shipping).

6 FACTORY CRIMP™ DIE
Screw the Lee Factory Crimp Die in to touch the shell holder, plus 1/2 turn more. Adjust in for a heavier crimp. It is usually best to start with too little crimp, as you can readjust and crimp again to suit your needs. When the four splits in the collet are closed, maximum crimp has been achieved. Do not try for more as the die will be damaged and the crimp excessive.

Bullets do not need a crimp groove as the Lee Factory Crimp Die will form one while crimping. However, it requires a harder push on the press lever to form the crimp.

ADJUSTMENT FOR LEE PRESSES
Screw the sizer die in until it contacts the shell holder, plus 1 turn more (1/4 turn for Classic series press owners). Run a case into the die. You will feel the primer being extracted, then the lever will come to an abrupt stop. At this point, the lever must be pushed firmly (min. 25 lbs.) to close the collet and size the neck. Extra bullet grip can be obtained by screwing the die in an additional quarter-turn.

Other brands of presses that toggle or snap over center at the end of the stroke provide no feel and can damage the collet neck sizing if adjusted as above. We suggest the die be screwed in until the die contacts the shell holder, plus 2 FULL TURNS. This will prevent the press from toggling over center and give the operator feel of the collet closing.

OPTION: Even greater accuracy can be obtained by rotating the case one-half turn and sizing the case a second time.

TIGHTER BULLET FIT
As delivered from the factory, the collet die will grip the bullet with a light press fit with cases of average hardness. For a tighter fit, you can anneal the case neck or polish the decapper mandrel .001 smaller. Do not go beyond .001 smaller as there will be no increase in bullet pull, and a decrease in accuracy as the bullet will then be holding the neck as it is inserted.

OPTION: The collet die provides the optimum bullet fit for maximum accuracy and case life. Should you desire a tighter fit, and are not able or willing to polish the mandrel or anneal the case neck, you can order a custom mandrel from the factory. Be sure to specify the caliber and bullet diameter. Example: “Send undersize collet die mandrel for .30/06 using a .308 bullet.” There is a $11.00 charge; $5.00 for the undersize mandrel + $6.00 for shipping.

The LEE Ergo-Prime Hand Primer, requires special, but inexpensive shell holders. 00210

LEE BREECH LOCK CHALLENGER PRESS
The “O” frame press by design is the strongest and the most popular style press by far. Large-opening and long stroke handles the largest belt magnum cases. The primer catcher is positive and routes the spent primers directly to the trash can. Priming is a dream with the Lee Lever Prime System. Best of all, it includes the Breech Lock Quick Change Die System. Change dies instantly with a twist of the wrist; you’ll never have to re-adjust your die.

Other features include steel linkage with adjustable length lever: this same press will cost you more than twice as much from other manufacturers, and that’s without all of the Challenger’s features. If cost is more important than convenience, you can leave the Breech Lock bushing locked in the press and screw dies in and out like any conventional press.
